Benefit	Description																
Performance	While not neces	While not necessarily designed for high-throughput transactions like public blockchains, Hyperledger Indy can achieve reasonable performance for specific use cases. It focuses on scalability through features like sharding and ledger pruning, allowing it to handle increasing workloads efficiently															ds efficiently.
Interoperability	Hyperledger Ind	Hyperledger Indy prioritizes interoperability across different blockchains and distributed ledger technologies (DLTs). This enables identity data to be shared and used seamlessly between various applications and organizations, regardless of their underlying infrastructure.															
Self-Sovereignt	Users have com	plete control over	their identity data	in Hyperledger In	dy. They can choo	se what informat	on to share, with	whom, and for wh	at purpose, empo	wering them with	greater privacy ar	nd control over the	eir digital identity.				
Security	Hyperledger Ind	y leverages crypto	graphic protocols	and secure encla	ve technologies to	ensure the confi	dentiality and inte	egrity of identity da	ta. This helps pro	tect sensitive info	mation from unau	thorized access a	and manipulation.				
Flexibility	Hyperledger Ind	y offers a modular	and flexible archi	tecture, allowing o	developers to cust	omize the platform	n to meet their sp	ecific needs. They	can choose the	components and f	unctionalities that	best suit their use	case, promoting	greater adaptabil	ity.
